Announcements

- The Research Conference will be held at the Moscone Center, West Building.
- Registration will be held on the Third Level, Moscone West Building. **Registration is required for attendance, and badges must be worn for all sessions.**
 - o Monday, 4:00 p.m.–7:00 p.m.
 - o Tuesday, 7:30 a.m.–3:00 p.m.
- On Wednesday, the Research Conference is open to all registered attendees of the NCTM Annual Meeting and the NCSM Annual Conference. Badges from these conferences will be required for attendance for all sessions on Wednesday.
- A light reception will be held on Tuesday evening on the Third Level Lobby, Moscone Center, West Building from 4:45 p.m. to 6:00 p.m.
- Research Posters Sessions will take place on the Third Level Lobby, Moscone Center, West Building
 - o 5:00 p.m.–6:00 p.m. on Tuesday
- The Call for Proposals for the 2017 NCTM Research Conference will be available online by early June 2016.
- The NCTM Bookstore will be open on Wednesday 10:00 a.m. – 7:00 p.m in the Exhibit Hall D, North building, Moscone Center.

NCTM Board of Directors

Diane J. Briars, President; Pittsburgh, Pennsylvania

Invited Sessions

Opening Session

Cynthia W. Langrall

JRME: A Tale of Unicorns, Mastodons, and Ants (Session 1)

Monday, April 11, 5:30 PM-7:00 PM

Moscone West, 3001/3003/3005

Access, Equity, Identity and Agency (Session 1.5)

Tuesday, April 12, 7:30 a.m. – 8:20 a.m.

Moscone West, 3001/3003/3005

Graduate Student, Junior Faculty, and Researcher Mentoring Session (Session 36)

Tuesday, April 12, 10:00 a.m. – 11:15 a.m.

Moscone West, 3002

Teacher Development in Statistics Education: A Critical Examination of How Teachers' Experiences Impact Their Knowledge, Beliefs, and Practices for Teaching Statistics (Session 39)

Tuesday, April 12, 10:00 a.m. – 11:15 a.m.

Moscone West, 3006

Writing for the NCTM School Journals: Publishing Your Research in Teacher-Friendly Articles and Linking Research and Practice Awards (Session 40)

Tuesday, April 12, 10:00 a.m. – 11:15 a.m.

Moscone West, 3000

"Power Concedes Nothing without a Demand": Challenging the Pervasive Deficit Discourse about Children in Mathematics Education (Session 60)

Tuesday, April 12, 1:15 p.m. – 2:30 p.m.

Moscone West, 3006

The Role of Theoretical Frameworks in Research Dissemination: JRME Editorial Panel Session (Session 65)

Tuesday, April 12, 1:15 p.m. – 2:30 p.m.

Moscone West, 3000

Approaching Intersecting Challenges: Mathematics Remediation at Four-Year Universities and Mathematics Identity as a Lens on Inequitable Access (Session 83)

Tuesday, April 12, 3:30 p.m. – 4:45 p.m.

Moscone West, 3006

Mathematics Education Research, Policy, and the National Science Foundation (Session 90)

Tuesday, April 12, 3:30 p.m. – 4:45 p.m.

Moscone West, 3016

Expanding Horizons in K – 3 Geometry and Spatial Thinking: The Implementation and Results of a New Curriculum and PD Model (Session 148)

Wednesday, April 13, 8:30 a.m. – 9:45 a.m.

Moscone West, 3006

What is STEM Education? (Session 156)

Wednesday, April 13, 8:30 a.m. – 9:45 a.m.

Moscone West, 3008

Writing *Mathematics Teacher Educator* Manuscripts That Avoid Common Mistakes Aspiring Authors Make (Session 157)

Wednesday, April 13, 8:30 a.m. – 9:45 a.m.

Moscone West, 3000

Plenary Session

Brent Davis

How Research into Second-Language learning Might Be Useful to Mathematics Educators (Session 158)

Wednesday, April 13, 10:00 AM – 11:30 AM

Moscone West, 3001/3003/3005

MET Grants Support Classroom Research (Session 177)

Wednesday, April 13, 1:15 p.m. – 2:30 p.m.

Moscone West, 3009

Transformative Math Teaching and Learning: Stories from Railside High (Session 178)

Wednesday, April 13, 1:15 p.m. – 2:30 p.m.

Moscone West, 3006

Floor Plans

Moscone West

Welcome!

On behalf of Research Committee of the National Council of Teachers of Mathematics (NCTM) and the Special Interest Group/Research in Mathematics Education of the American Educational Research Association, we welcome you to NCTM's Research Conference.

The Research Conference serves multiple purposes. The Research Conference

- brings researchers together annually to examine and discuss current issues in mathematics education;
- provides an opportunity for researchers, beginning and seasoned, to receive feedback on their work and to benefit from exposure to alternative points of view;
- affords opportunities to interact and network with other researchers in the field; and
- allows the field to capitalize on the collective wisdom available when researchers and practitioners come together to discuss mathematics education and research.

The Research Conference continues to receive many high quality proposals from the community. This year we received 389 submission and extended 207 acceptances for the final program, giving an overall acceptance rate of 53%. You will see an expansion of Brief Research Reports to better accommodate the larger number of submissions in that category. The conference program also includes several invited sessions highlighting topics and new trends relevant to the field.

We thank the members of NCTM's Research Committee, members of the executive board for the SIG/RME, and the members of the research community who served as reviewers. Your work is greatly valued and appreciated. Moreover, we would like to thank the staff at NCTM for helping us with the logistics of the conference, registration, the program, and all that makes the conference run smoothly. We would like to thank all the presenters for their thoughtful proposals and their willingness to share their work. Finally, we would like to thank everyone in attendance, and we hope that you will find the conference stimulating and enjoyable. We are glad you are here.

Sincerely,

Kathryn Chval
NCTM Research Committee, Chair

Ilana Horn
AERA SIG/RME Co-Chair

Janine Remillard
AERA SIG/RME Co-Chair

David Barnes
NCTM Research Committee, Staff Liaison

Opening Session—Monday, 5:30 p.m.

Cynthia W. Langrall, *JRME* Editor
JRME: A Tale of Unicorns, Mastodons, and Ants
Monday, April 11, 2016: 5:30 p.m.–7:00 p.m.

3001/3003/3005

Monday, April 11th

5:30 p.m.–7:00 p.m.

1

JRME: A Tale of Unicorns, Mastodons, and Ants

Opening Session

What do unicorns, mastodons, and ants have to do with the *Journal for Research in Mathematics Education*? Join me at this opening session of the Research Conference to find out. I will share insights I have gained as editor of the journal, which point to challenges and opportunities for mathematics education research.

For your safety and because of fire regulations, only those with seats will be allowed in meeting rooms. To comply with fire codes, we will have to ask any persons sitting on the floor or standing to leave the room.

Please remember:

- All meeting rooms will be cleared between presentations.
- All seats are available on a first-come, first-served basis.
- Reserving spaces in line or saving seats is not permitted.
- As a courtesy to the speaker and your colleagues, please turn off your cell phone during all presentations.

7:30 a.m.–8:20 a.m.

1.5

Access, Equity, Identity and Agency

Discussion Session

What structures and conditions need to be created and dismantled for the brilliance of marginalized children to flourish? As a community what collaborative and courageous actions can we take to affect and sustain change? Come join, collaborate and participate.

Matt Larson, NCTM President-Elect

Lincoln Public Schools, Nebraska

David Barnes

NCTM, Reston, Virginia

3001/3003/3005

8:30 a.m.–9:00 a.m.

2

A Classroom Intervention: Strengthening Prospective Elementary Teachers' Knowledge of Divisibility

Brief Research Report

This brief report presents a study investigating the impact of a sequence of instructional tasks on prospective elementary teachers' (PSTs') knowledge of divisibility. Analysis of written assessments revealed significant improvements in PSTs' use of prime factorization to identify a variety of factor types, signaling a diminished dependence on more traditional and error-prone methods.

Matt B. Roscoe

3

A Practical and Powerful Screener of Middle School Mathematics Difficulties

Brief Research Report

This study identifies a fraction screener administered in elementary school as a strong diagnostic tool for the prediction of later middle school mathematics difficulties. Practitioners can utilize the screener to identify students who need supplemental support in order to attain desired mathematics benchmarks.

Activity and Impact of Elementary Mathematics Specialists in Rural Schools

Brief Research Report

This session will present the findings of a two-year randomized control-treatment study that investigated the impact of elementary mathematics specialists on student achievement in rural schools, characterized the amount and type of specialists' professional activity, and, in treatment schools only, evaluated the relationship between the focus of specialists' activities and student achievement.

An Analysis of U.S. Expert Teachers' Lessons on Inverse Relations

Brief Research Report

This study explores eight U.S. expert teachers' algebraic knowledge for teaching (AKT) through analyzing 32 videotaped lessons on inverse relations (grades 1–4). Based on three IES recommendations, we explore common features of teachers' effective use of worked examples, representations, and deep questions in existing classrooms. Challenges in these instructional components are identified.

Angle and Slope Connections: Challenging Teacher Assumptions in Trigonometry**Brief Research Report**

Using a series of tasks and video, we challenged beginning teachers to consider trigonometric relationships between angles and slope. This presentation focused on a common misconception these tasks revealed in trigonometric reasoning and on how the task prompted teachers to reconsider their assumptions.

Approaches to Constructing General Mathematical Statements**Brief Research Report**

I will share results from a study of university students' construction of general mathematical statements. From analysis of data from ten students in math-focused majors, I describe approaches to constructing domains of applicability for given property statements. The approaches have implications for designing activities to increase students' proficiency at conjecturing generalities in mathematics.

8

Are Adolescents' Views of Mathematics Changing?**Brief Research Report**

This study examines how adolescents' view of mathematics as a gendered domain varies based on one's gender and class type (i.e., single-sex or coeducational). One significant finding from the study is that participants typically associated mathematics as a neutral domain (i.e., for both females and males).

Attending to Precision in Statistics**Brief Research Report**

The Common Core Standards for Mathematical Practice are processes and proficiencies that mathematics educators would like to develop in their students. In this session, we present a case study of three teachers, which looks at the prevalence of Mathematical Practice 6, Attending to Precision, in a professional development statistics course for in-service teachers largely focused on open-ended activities. We also illustrate how the elicited Attending to Precision may differ in the context of statistics compared to mathematics.

"It Won't Work Every Time": The Refutations of Preservice Teachers**Brief Research Report**

Reforms to the teaching of mathematics encourage teachers to support students both in making conjectures and refuting those that are false using counterexamples. This study reports on the counterexamples provided by 17 preservice elementary teachers when asked to refute students' false conjectures about fractions. The analysis drew upon existing frameworks to distinguish the pedagogical power and accessibility of counterexamples. Findings indicate that preservice elementary teachers' counterexamples lacked pedagogical power. Additionally, counterexamples that lacked pedagogical power also varied in terms of: (a) their mathematical complexity and (b) their ability to mirror the reasoning used by the student who authored the false conjecture being refuted. Future work may examine how counterexamples displaying a range of mathematical complexity and mirroring ability support students in abandoning their false conjectures.

12

Professional Identity and Cultural Competence Development among STEM Professionals

Brief Research Report

This study followed eight preservice teacher career-changers, of varying STEM backgrounds, on their journeys to becoming urban mathematics teachers. Participants had an opportunity to gain a new identity as a culturally responsive teacher entering the teaching profession. This study gave voice to preservice teachers' evolving views, insights, and experiences during the process of constructing and reconstructing their professional identity and cultural competence as a mathematics teacher preparing to meet the educational needs of a diverse population of students in an urban high-need school district.

The Influence of Consecutive Flipped Courses on Students' Math Anxieties

Brief Research Report

This session will examine how taking consecutive mathematics courses for elementary preservice teachers influenced their anxieties and perceptions of teaching and learning mathematics. Participants will examine preliminary data and discuss how this may impact those interested in trying to integrate flipped learning into their teaching practices.

Understanding How to Differentiate Instruction for Middle School Students

Brief Research Report

Today's middle school mathematics classrooms are marked by increasing cognitive diversity. Traditional responses to cognitive diversity are tracked classes that contribute to opportunity gaps and can result in achievement gaps. Differentiating instruction (DI) is a novel but untested response to cognitive diversity, in which teachers proactively plan to adapt pedagogical activities to address individual students' needs in an effort to maximize learning for all students. This paper reports on this question: How did pedagogical activities facilitate and impede differentiating mathematics instruction for middle school students in an after school design experiment? The data comes from an 18-episode experiment with nine cognitively diverse seventh- and eighth-grade students, focusing on four episodes in which students worked on representing multiplicative relationships among quantitative unknowns. Analysis revealed two pedagogical activities that facilitated DI and three that both facilitated and impeded it.

Beyond the Demonstration of Procedures in YouTube-Style Math Videos

Brief Research Report

Despite the tremendous growth in online mathematics videos for K–12 students, there is surprising uniformity in the expository mode of presentation and the procedural nature of the content. The purpose of this study was to locate, analyze, and categorize the approach of conceptually and/or dialogically oriented online math videos.

3007

17

Connections among Mathematics Vocabulary, General Vocabulary, and Computation

Brief Research Report

Understanding mathematics is more than working with numerals and symbols. In many instances, students must interpret vocabulary terms (e.g., prime number, improper fraction) to understand mathematics concepts and procedures. We conducted an analysis of the mathematics vocabulary knowledge of students at grades 1, 3, and 5. We present the longitudinal mathematics vocabulary knowledge of students as well as how general vocabulary and computation knowledge predict mathematics vocabulary understanding.

22

Developing Facilitation Practices in a Secondary Math Teacher Learning Community

Brief Research Report

Research has shown that teacher learning communities have potential in supporting teacher learning of more ambitious practices. In this paper, we contribute to an emerging body of work on development of facilitator practices. We provide a provisional trajectory based on an analysis of a facilitator's practices in leading a secondary mathematics teacher learning community, and we describe how facilitation practices developed to increasingly provide opportunities for teacher learning. This expanding image of development will help to design supports for math leaders as they continue their work with teacher learning communities.

Developing Knowledge and Theory of Math Education through Action Research

Brief Research Report

This study examines teachers' understanding of reform-based mathematics education as they engaged in action research, a major component of a sustained professional development initiative. Data are analyzed through the lenses of student thinking, mathematics content, and social interaction. Knowledge acquisition and theory generation are reported, as well as the processes used in implementing the action research.

Does Experiential Learning Influence the Way Students Learn Mathematics?

Brief Research Report

This experimental study aims to determine if teaching mathematics while respecting the four stages of the experiential learning cycle of Kolb (1984) has an effect on grade 7 students' learning of probabilities. During the session, the study will be presented and participants will be invited to discuss how experiential learning can be integrated into the classroom. A discussion will also aim to develop a better understanding of the results.

Underrepresented Students Pursuing Mathematics Degrees: Changes after Transitioning to College

Brief Research Report

This longitudinal qualitative study followed a cohort of mathematics-intending underrepresented high school students into their freshman year of college to identify changes on their path to mathematics-intensive degree attainment. Results indicated that four of the seven participants persisted on their degree path while the remaining

three switched to less-mathematics-intensive programs. The greatest positively contributing factor for the participants who persisted was participation in collaborative learning with their peers in mathematics. The participants who did not persist reported that they experienced a decrease in their sense of competence in mathematics when they transitioned from high school to college. All participants, whether they persisted or not, reported that they felt underprepared for college-level mathematics. These results highlight the continued need for increased collaboration between stakeholders at the secondary and postsecondary levels.

Using Video to Prepare Preservice Teachers to Pose Purposeful Questions

Brief Research Report

This study documents the effects of exemplar video observation on the development of deep questioning skills of preservice teachers (PSTs) with (experimental) and without (control) direct depth of knowledge instruction in a mathematical content course for K–8 preservice teachers. In particular, we examine the questioning strategies used by preservice teachers in written responses related to Common Core-aligned videotaped math lessons. Data was analyzed to develop multitiered general categories and levels of questions used by the PSTs. Through an examination of the trending categories and question levels relational to the videos we offer suggestions for preservice teacher education courses.

20 Weeks to Better Eliciting: A Case of Teacher Preparation

Discussion Session

Beginning elementary teachers struggle with knowing and identifying their students' mathematical knowledge. Knowing their students' thinking allows teacher to tailor instruction to their individual students' needs and understandings. This study describes how 10 preservice teachers, purposely selected from a cohort of 28, developed their eliciting student thinking practice over a 20-week period in their practice-based teacher education program.

Assessing Secondary Teachers' Mathematical Habits of Mind**Discussion Session**

In this session, we share ongoing work to develop instruments to assess secondary teachers' mathematical habits of mind (MHoM). We envision MHoM as a critical component of mathematical knowledge for teaching. Moreover, many of the eight Mathematics Teaching Practices in NCTM's *Principles to Actions* depend on teachers' MHoM for implementation. We are investigating the research question: What are the MHoM that secondary teachers use, how do they use them, and how can we measure them? The focus of the session is on our paper and pencil (P&P) assessment that measures how teachers use MHoM while doing mathematics on their own. Session participants will engage in working through the P&P items, rubrics, and sample teacher responses. Participants will also have an opportunity to share questions, concerns, and reactions to the items. The discussion will center on the challenges of validity, reliability, scoring, and use of the P&P assessment.

Complementary Approaches to Formative Assessment in Mathematics**Research Symposium**

The Common Core State Standards (CCSS) present unprecedented opportunities and challenges for schools and districts as they work to adopt the standards. The stakes are high for students, teachers, and administrators. We offer the use of formative assessment (FA) as one instructional approach to help practitioners leverage these standards to develop mathematical procedural skills, reasoning abilities, and conceptual understanding in students. Using the work from two research universities, this symposium will present an overview of two complementary approaches to FA and will present findings from joint validity studies of two intervention studies.

Generalization across Multiple Mathematical Areas**Research Symposium**

Generalization is a key aspect of doing mathematics, with policy makers recommending that it be a central component of instruction from elementary school through undergraduate mathematics. This recommendation poses serious challenges, however, given students' difficulties in creating and expressing correct generalizations. Furthermore, how to foster productive generalization is not well understood. This symposium addresses these challenges by introducing a comprehensive framework characterizing productive mathematical generalization in grades 8–16. Four related projects across the domains of algebra, geometry and combinatorics share results on students' generalizing activity in interview settings, identifying (a) categories of mental content making up the basis of students' operating, and (b) categories of activity types supporting the formation of generalizations. The presentations will be followed by a discussion of the links between insight, generalizing, and justifying.

Grappling with Ready-Made Narratives around Race, Motivation, Achievement, and Opportunity in Mathematics

A prominent feature of K–12 education is the widespread endorsement of a narrative that to achieve in mathematics one must solely be motivated enough. This narrative articulates a direct link between individual motivation and academic achievement, and is employed by a range of educational stakeholders. In STEM domains, especially mathematics, this narrative is often coupled with another suggesting that a special intelligence is required for people to do math and science. We argue that the tendency to enlist such narratives to make sense of math achievement is problematic with respect to the views students from nondominant (and dominant) racial, ethnic, and linguistic backgrounds develop of their intelligence and capacity for success in STEM. Narratives such as these obscure the role of broader sociopolitical structures and hierarchies in shaping individual and group success in school. In this paper, we analyze the negotiation of such master-narratives by students from nondominant backgrounds as they figure themselves and others in the world of mathematics and school achievement. We draw upon Ochs and Capp’s (2001) notion of lived narratives to explore the kinds of stories students evoked in positioning themselves and others around mathematics and school achievement. Our analysis demonstrates the importance of initiating and orchestrating conversations that support students in explicitly grapple with these master-narratives.

The Construction of Disability in Racial Storylines in Mathematics

Identification with mathematics for students of color is complicated by racial storylines (Nasir and Shah 2011). This presentation explores the underlying construction of ability, thus disability, in racial storylines, exploring the complex narratives of a Latina with a learning disability on race, language, and disability in mathematics.

Ways in Which Engaging in Someone Else’s Reasoning Is Productive

Typical goals for inquiry-oriented mathematics classrooms are for students to explain their reasoning and to make sense of others’ reasoning. In this paper we offer a framework for interpreting ways in which engaging in the reasoning of someone else is productive for the person who is listening and making sense.

Middle School Students’ Development of Algebraic Reasoning: Comparing Effects of Three Instructional Approaches (Visual, Structural, and Modeling)

This algebra-readiness study was based on a teaching experiment with three seventh-grade classes in a Midwestern middle school. Three different algebra approaches to early algebra—a Modeling approach, a Visual-Number approach, and a Structural approach—were employed, with just one approach being taught to a particular class. The same teacher (Ms. X) taught all three classes, each for a period of seven weeks. Before the teaching experiment, Miss X had participated in a three-week professional development program led by the researcher and two experienced algebra education professors. Pre-teaching and post-teaching data were collected, the instruments being an Algebra Readiness test (ART), a Modeling test, a Visual-Number test, and a Structure test. In addition to data gathered from

responses to the pencil-and-paper instruments, data from 36 one-on-one interviews with students (18 pre-teaching and 18 post-teaching) were analyzed. Initial findings indicated that whereas the Modeling class's mean gain score was significantly different from zero, the mean gain scores for the other two groups increased only slightly. In this paper the data analyses are summarized and results interpreted.

How Do Children Really Measure? Strategy Use on Assessment Tasks

We conducted 1-on-1 interviews with 1060 pre-K–grade 2 children using measurement assessment items. This paper focuses on using qualitative analysis of children's strategies to guide and inform the larger, statistical analyses. These analyses help solidify the cognitive profiles and also enhance our understanding of children's development.

37 Oral Assessments as Learning Opportunities for Preservice Teachers

Discussion Session

This session draws on 114 videos of oral assessments (38 students, 3 exams each) from a number and operations course for pre-service elementary teachers taught in two sections at a large research university. We are using this video data to address the following questions: 1. What student learning gains do we observe taking place during an oral assessment? 2. What characteristics of this assessment format support the learning gains we observe? In this interactive session, participants will watch selected video clips and discuss how one recognizes and characterizes learning opportunities, specifically in the context of oral assessments in math content courses for preservice elementary teachers.

38 Research on Math Teacher Education in an Online Multimedia Environment

Research Symposium

In the research symposium we share results from several studies investigating the use of LessonSketch, an online multimedia environment, and how it supports practice-based teacher education. LessonSketch is an online environment where teachers can create, discuss, annotate, and share representations of teaching (Chieu and Herbst 2012). We share research that examines the use of LessonSketch tools for solving challenging problems of practice that are common in teacher education. Presentations will span teachers' development of content knowledge necessary for teaching and rehearsal of skills associated with essential instructional practices.

39 Teacher Development in Statistics Education: A Critical Examination of How Teachers' Experiences Impact Their Knowledge, Beliefs, and Practices for Teaching Statistics

Invited

Today's teachers are faced with a difficult task of teaching statistical topics and approaches. This session will take a critical look at teachers' learning opportunities in statistics content and pedagogy across a spectrum of contexts in undergraduate teacher preparation, in-person local professional development, and professional development in a massive open online course serving teachers around the world. In all three contexts we seek to understand how the nature of experiences with which teachers engage impacts their content knowledge, beliefs about statistics learning and teaching, and their classroom practices. Reaction and commentary will connect to suggestions from the American Statistical Association.

Evaluating the Effectiveness of Symmetry Software for Early Elementary Children

Brief Research Report

Children develop the ability to perceive symmetry very early in life; symmetry is abundant in the world around us, and it is a naturally occurring theme in children's play and creative endeavors. This study sought to develop and evaluate a computer program that expands young children's understanding of symmetry and its subtypes—reflection, translation, and rotation. Results showed that children assigned to the experimental condition were better able to identify and explain symmetry subtypes than the control group. Children who used the symmetry software also showed improvement compared to their peers in the control group in completing translation tasks and in overall posttest scores, controlling for pre-existing ability.

Examining the Impact of Multiple Representations on Students' Achievement

Brief Research Report

This study examined the impact of two teaching approaches (i.e., traditional algorithmic versus instruction using multiple representations) on middle school students' achievement on problems that integrated fractions, decimals, and percents. Results indicated gains in achievement with both teaching approaches; however, a statistically significant higher achievement gain was found with the traditional algorithmic approach. In terms of the order of teaching approaches, no significant differences were found.

Exploring the Narratively Constructed Mathematical Identities of Latina Bilingual Students

Brief Research Report

This study involved exploring the mathematics stories of three seventh-grade Latina students who attended an urban middle school. The mathematics stories of one primary caregiver for each student and the students' mathematics teacher were also explored. The goal was to understand the factors that attributed to the formation of the young girls' mathematics identities and how these identities informed their decisions to engage with mathematical activity. The findings illuminated important classroom experiences, how the students

made sense of these experiences, and how they took up and rejected opportunities to engage with mathematics because of those experiences.

Preservice Teachers' Horizon Knowledge for Teaching Addition and Subtraction

Brief Research Report

Teachers' ability to connect what they are teaching to other related topics is central in their teaching. Analyzing video presentations of elementary preservice teachers, this study examined characteristics of their competence in connecting concepts that they are teaching to other relevant mathematics ideas. Results showed that participants preferred to connect addition and subtraction to concepts previously learned, such as place value, regrouping, number composition, and counting strategies, while paying less attention to the concepts that students will learn later, such as the inverse relationship of addition and subtraction, and the associative and commutative properties. The implications of this study for future research and mathematics teacher preparation are discussed.

52 Using Content Maps to Represent Qualities of Teachers' Mathematical Instruction

Brief Research Report

A scaling-up study of the SimCalc approach revealed significant learning gains that were robust across demographic and regional variation in teachers and students. In order to determine what might have contributed to these gains, we theorized that students' opportunities to engage with content would be a significant source of information about what and how students learned. We developed a representational tool we call Content Maps that we used to analyze the content of classroom discourse around mathematical tasks. Maps that were generated from three teachers' enactments of three lessons reveal the various ways in which these teachers drew on their mathematical knowledge in whole-class discussion. These maps may therefore prove to be a more useful assessment of their mathematical knowledge as a learning resource than quantitative measures of their mathematical knowledge for teaching.

54 Cracking Her Codes: Investigating Technology Boundary Objects Using Interaction Analysis

Discussion Session

We describe a cross-departmental, cross-university research collaboration project aimed at understanding the extent to which technology tools function as boundary objects for high school females in a math camp setting. Emergent results from our interaction analysis suggest that technology tools when viewed as boundary objects served different purposes for different student pairs—one was

a sharing purpose, and one was a use to put up a wall—in different figured worlds. The effects of these purposes were weighty in terms of participation and engagement in the mathematical task. Participants will examine multiple excerpts from our data and help us think about how to move our ideas forward in ways that are productive, novel, and helpful to a broad audience.

“Power Concedes Nothing without a Demand”: Challenging the Pervasive Deficit Discourse about Children in Mathematics Education

Invited

While equity is a stated priority for the mathematics education community, many children continue to have an inequitable mathematics education. Inequities are often rationalized by research-based practices that perpetuate institutionalized forms of discrimination and rank cognitive, cultural, and linguistic capacities of children to learn mathematics. The purpose of this panel is to highlight theoretical and empirical approaches that actively challenge the pervasive deficit discourses about historically marginalized youth’s engagement and success in learning mathematics. Panelists will dialogue about tensions and trajectories of this work that challenges dominant deficit views and demands a more just mathematics education for our nation’s children.

Understanding Practices Preservice Teachers Use to Elicit Students' Thinking

Discussion Session

Instructional practices that make students' mathematical ideas available are essential to successful teaching. Eliciting in ways that uncover student thinking is a complex practice that needs to be learned. In some cases it might require unlearning approaches commonly used in everyday life. Participants will explore examples of preservice teachers' eliciting practices in which preservice teachers state a student's thinking and ask the student to agree/disagree with the statement. Participants will discuss the form and function of this practice, one that the researchers call "filling," and ways in which teacher educators could support awareness of the practice and the use of alternative approaches.

How Secondary Students Determine the Validity of Mathematical Arguments

Brief Research Report

The study investigated the factors students considered when evaluating the validity of mathematical arguments. Analysis of 8 eighth graders' interview transcripts indicated that when determining the validity of mathematical arguments, the source of conviction seemed to have the largest impact, followed by the presentation of the argument, while the link to conclusion (or mode of reasoning) seemed to have the least impact.

How Teachers' Evaluate Breaches of Norms in High School Geometry

Brief Research Report

This paper reports on a study of two norms of an instructional situation in high school geometry—Geometric Calculation in Algebra—that consisted of confronting practitioners with representations of practice

as a way to stimulate them to relay their knowledge of practice. The purpose of the study was to determine whether participants recognize two hypothesized norms and how those participants evaluate actions that breach them. The focus of this paper is on our use of the Appraisal system (Martin and White 2005) in Systemic Functional Linguistics to detect evidence of participants' evaluation of the breaches of one of those norms.

Hypothesizing Fragmented Growth of Mathematical Proficiency for Teaching

Brief Research Report

We compare two accounts of change in preservice teachers' (PSTs') knowledge and motivation for teaching multi-digit addition and subtraction that were a result of taking a mathematics methods class. Using scales with strong psychometric properties, we found knowledge increased but found no evidence of change in motivation. However, by comparing pre- and posttest responses item by item we found compelling patterns of linked change.

Impact of Early Algebra Instruction across Populations of Diverse Learners

Brief Research Report

Algebraic thinking and reasoning have been identified as an important and emerging curricular strand in K–8 education. Recognizing that historical paths to algebra have been largely unsuccessful, scholars now advocate that students have long-term algebra experiences, beginning in the elementary grades. Our purpose in this paper is to determine how students with low standardized test scores after receiving an algebra curriculum treatment perform relative to control students of all standardized performance levels.

Initial Understanding of Fractions: Children with Learning Disabilities and Difficulties

Brief Research Report

Little to no information exists explaining the nature of initial conceptions of fractions held by students with learning disabilities. This study extends existing literature by presenting key indicators of understandings of fractional quantity of 44 children with learning disabilities and difficulties as evidenced through their problem-solving strategy, observable operations, and language across six tasks based in the measure and partitive interpretations. Constant comparison analysis of the children's work across the tasks documents indicators reflective of a framework. Pending future research, the framework may be a useful tool to practitioners wishing to document students' initial conceptions of unit fractions.

Ambitious Enactments in Secondary Math Methods Courses

Discussion Session

We share research on the design and use of instructional activities (IAs) in secondary mathematics methods courses. IAs provide opportunities for teacher candidates (TCs) to develop skill with instructional practices, such as those in Principles to Actions (Leinwand, Brahier, Huinker et al. 2014), that provide students opportunities to productively engage with mathematical ideas. Because the skilled use of instructional practices is dependent on interactions with students, IAs situate TC learning in authentic classroom settings. The session begins with theoretical perspectives of designing and using IAs in secondary mathematics methods courses and our research questions. We also

share the structure of an IA, Going Over a Problem, which secondary TCs enact in authentic classrooms settings. Our presentation ends with comments from a discussant. The second half of the session is a discussion among the audience and presenters around the design and use of IAs in secondary methods courses.

Approaching Intersecting Challenges: Mathematics Remediation at Four-Year Universities and Mathematics Identity as a Lens on Inequitable Access

Invited

In recent articulations of “grand challenges” in mathematics education, equity has received renewed attention and has been framed as a prevailing concern for researchers. In this talk, I reframe this challenge as one that requires us to unpack empirically how inequities adhere to institutional practices and policies—and how they ultimately impact the mathematics socialization of learners. I describe two projects that focus on examining the mathematics identities that learners construct in non-credit-bearing remediation courses amid their transitions to universities. By attending to mathematics identities as an empirical lens, I argue that such research can contribute much-needed perspectives on a longstanding and largely inequitable phenomenon.

Learning from Assessment Data: Epistemic Foundations of Data Use

The authors take a grounded theory approach to investigating how math educators use assessment data to inform instruction. Educators make epistemic assumptions about what data represent, which lead to different epistemic practices around how data are used. By identifying the ways educators make sense of data, the authors provide recommendations to inform educators' professional learning opportunities.

A Unified Framework of Teachers' Conceptions of Learning and Assessment

The National Research Council's (2001) report, "Knowing what students know," called for assessments to be explicitly connected to models of student learning. Notably, this call is not just for large-scale assessments designed by psychometricians, but also for classroom assessments designed by teachers. This means that teachers' conceptions of learning and assessment should be understood in relation to each other. However, while there has been considerable research into teachers' conceptions of learning and assessment individually, there is no research that explores the connection between the two. In this presentation, we address this gap by exploring the question, "how do math teachers conceive of learning and assessment?" We present our results in the form of a unified framework of teachers' conceptions of learning and assessment.

New Research on Extending Multiplicative Relationships beyond Whole Numbers

Research Symposium

This symposium brings together three current NSF-funded projects that use constructivist perspectives to investigate extensions of multiplicative reasoning beyond whole numbers. The projects differ in the variants of constructivist perspectives they use, the populations they study, and the mathematical topics they choose. The perspectives include variants of radical constructivism and knowledge-in-pieces. The populations include elementary students, middle grades students, and preservice teachers. The topics include fraction multiplication, multiplicative relationships between quantitative unknowns, and proportional relationships between co-varying quantities. Comparing insights across projects will advance and broaden our understanding of what might be involved in teaching and learning core upper elementary and middle grades content in ways that take into account how learners' prior knowledge both supports and constrains extensions of multiplicative reasoning beyond whole numbers.

Structuring Two- and Three-Dimensional Space: A Focus on Representations

Research Symposium

In this session we will discuss four related studies focused on students' understanding of structuring two- and three-dimensional space. In these four sessions we will address two main questions. First, in what ways do the different aspects of volume measurement including filling, packing, building, and comparing, affect students' strategy use and conceptual understanding? Second, in what ways does instruction focused on structuring units affect students' understanding and skills in area and volume measurement and area estimation tasks? Participants will be engaged in discussion about the different aspects of volume as well as the role representations can play in students' perception of area and volume measurement.

Supporting Students' Mathematical Reasoning with Digital Tools

Research Symposium

While every publisher claims that their "digitally enhanced curricula" will improve students' learning, most such digital enhancements are drill and practice, videos of traditional lectures, or digital incarnations of pre-digital mathematical experiences. In contrast, what we call Deeply-Digital Representational Technologies (DDRTs) can uniquely change students' experiences in learning mathematics. DDRTs allow students to engage with mathematical representations that can only be expressed in digital technology, allowing them to develop new mathematical models, and expand their ability to express their mathematical reasoning. This session will describe three approaches to DDRTs: Each presentation will describe and demonstrate a particular approach, and by addressing a set of common questions, audience members will learn about commonalities and differences in the ways DDRTs can be used in classrooms.

When the Numbers Are There, But the Representation Doesn't Work

Discussion Session

In this session we will observe elementary students using self-generated representations to reason about computational patterns that are governed by the behavior of the arithmetic operations. Together we will examine and discuss what can be learned about students' developing operation sense by looking at their representations. In particular, we will consider how the salience of number and lack of attention to the arithmetic operations can short circuit student reasoning. Questions that bring the action of the operations into focus can help students align their representational, symbolic, and verbal descriptions and support the development of mathematical argument.

A CROSS-Institutional Effort to Develop Teacher Understanding about Statistical Investigations

Poster Session

This study investigates the development of teachers' understanding about statistical investigations as a result of a graduate course on teaching and learning statistics across two institutions. Using the

Guidelines of Assessment and Instruction of Statistics Education (GAISE) framework, we examined teachers' report as they use technological tools to examine two sets of data on the pre and post. Preliminary results show that teachers improved their understanding about four components of a statistical investigation—formulate questions, collect data, analyze data, and interpret results.

Children's Mathematics Experiences, with Significant Others, Prior to School**Poster Session**

This study investigated the types of activities parents view as contexts for preschool children's mathematics learning, as well as the differences and similarities in the activities within and across families. Parent-child dyads from six middle-class families were videotaped at home over two years as they participated in everyday events of their choosing (e.g., baking cookies, reading a story book) that the mothers believed involved mathematics learning. The results indicated that these mothers, predominately chose to videotape different types of play (29 activities) or everyday at-home events such as baking (15 activities). A limited number (11) of the activities involved commercially produced mathematics materials. Four families focused mainly on geometry concepts, one family engaged equally with geometry and number, while only one family focused primarily on number concepts. Implications of these young children's mathematics experiences prior to school are discussed.

Developing Teachers' Professional Noticing with Technology

Poster Session

While the importance of instruction that builds on student thinking and understanding has been advocated by both research (Fennema, et al. 1996) and policy documents (NCTM 2000), this type of instruction is often challenging for teachers to design and enact (Sherin 2002). Building on the teacher “noticing” research (Sherin, Jacobs, and Philipp 2011), we explore 24 mathematics teachers’ participation in a design-based research project. We report on the initial development of an online assessment and feedback environment and explore the question: What are the characteristics of an online assessment and feedback environment that effectively scaffolds teachers’ attention to student thinking and implementation of formative assessment?

English Learners' Participation in Mathematical Discourse

Poster Session

Due to the increasing diversity of mathematics classrooms, teachers need guidance on how to support English learners (ELs) in mathematics classes in a way that situates language learning within mathematical activity. Unfortunately, neither mathematics education research nor EL education research is sure how to navigate the complexity of teaching ELs mathematics while supporting both their language development and their mathematical development through their participation in mathematical activity. This study examined ELs’ participation in mathematical discourse, investigating how ELs used non-English language (NEL) symbol systems to support spoken English. I developed

the Replace Augment Learn (RAL) framework to describe how ELs used NEL symbol systems to make up for decreased English literacy. Findings show how ELs with basic conversational English can use literacy with a variety of symbol systems to participate meaningfully in mathematical discourse.

Relationship between Students' Attitude and Reasoning via TIMSS 2011

Poster Session

In this study, we investigated how students' attitude toward mathematics is related to mathematical reasoning skills through the TIMSS 2011 in comparing the differences between the U.S. and Finland. We use three TIMSS variables to observe students' attitude toward mathematics: liking mathematics, valuing mathematics, and confidence in mathematics. We applied a multistep linear regression model including interactions of the attitude variables and a mathematics reasoning score. As a result, we found that confidence in mathematics had positive relationships with mathematics reasoning at any levels of other attitude variables in both countries while liking mathematics and valuing mathematics showed significant interactions with other attitude variables. Generally, Finland showed stronger relationships than the U.S. The findings suggested mathematics educators and policymakers not to imitate others' education systems with regard to the complex relationships between attitude and reasoning.

Robotics, Computational Thinking, and Mathematics Achievement

Poster Session

This research report examines learning among 45 fifth, sixth, and seventh graders during Year 2 of a study on afterschool robotics clubs.

The time in this session will be used to present the context of the study and findings, as well as allow the audience to ask questions and offer suggestions for data capture in Year 3.

Secondary School Responsive Teaching: Noticing Students' Algebraic Generalizations

Poster Session

While a growing amount of research is devoted to exploring teachers' practice as they engage in responsive teaching at the elementary school level, less is known about the secondary school level. One particular challenge at the secondary school level is that well-developed learning trajectories of student thinking are uncommon. This study investigates two teachers who, after receiving extensive professional training, both create classroom environments where students' conceptions serve as a focus of their instruction and who are both able to attend to and interpret the details of student thinking. Notwithstanding these similarities, subtle differences in their classroom instruction result in major differences in outcomes. This session reports on these differences and highlights the important role learning trajectories play in responsive teaching and the professional noticing of students' mathematical thinking.

Teddy Bear Pre-K Math Assessment: Validation of a Game-Based Measure

Poster Session

This research evaluated an interactive, story- and game-based measure of preschool mathematical development. The hypothesis was that 9 measurable variables—quantification, counting, set comparison, numerals, number line, positional terms, shapes, addition/subtraction, and patterning—would make a significant contribution to the latent construct of mathematical development. CFA indicated good model fit: $\chi^2(24, N=118)=24.283$, $p=.446$; $NFI=.968$; $CFI=1.000$; and $RMSEA=.010$. All standardized path coefficients demonstrated both statistical and practical significance: regression weights ranged from .562 to .894. The results indicate that the measurement tool is a valid and reliable measure of mathematical development for this sample. Conferees will be able to view a child's assessment via laptop and discuss the developmental trajectories and statistical validation, as presented on the poster, with the researcher.

The Early Concept of Angle: Definition, Development, and Cognitively Diagnostic Assessment

Poster Session

The study investigates the early concept of angle—the angle-related knowledge, skills, and understandings appropriate and relevant for students in grades 3 through 5—in terms of cognitive attributes that underlie students' performance on angle-related mathematical tasks, identifies the leaning path(s) of the concept development, and creates a cognitively-diagnostic assessment of the concept.

The Mathematics of Cryptography and Cybersecurity

Poster Session

The purpose of this research is to determine the best pedagogical methods for introducing students to cryptography, key elements of cybersecurity, how cryptography is used to secure cyberspace, and the mathematics that supports modern cryptographic systems. The hypothesis is that early exposure to well-formed and engaging activities will increase the number of students entering higher education programs in cryptography and cybersecurity and later, the workforce as cybersecurity professionals. The importance of research such as this cannot be understated as increasing the size of the qualified and competent cybersecurity workforce has become a national priority. A mathematics-based unit to engage students was implemented. Data on student interest in cybersecurity and the mathematics involved

was collected and analyzed. Students used the Engineering Design Process to refine cryptographic protocols for sending messages that are encrypted, unmodified in transit, and authenticated.

Using Email Alerts to Motivate Mathematics Students: Will They Listen?

Poster Session

While educators are constantly searching for better ways to teach, it is often the behavior of the student that is most in need of changing. Busy social lives and jobs occupy much of college students' time and frequently academics suffer. Students often fall behind in classes without ever realizing it and are never able to catch up. This study examines the effects on student performance of email alerts sent to students who have fallen behind in their mathematics coursework, and whether they read the emails at all.

Analyzing Classroom Interactions by Coordinating Status and Positioning Theories

Discussion Session

This paper seeks to investigate classroom interactions through the coordination of Status and Positioning Theories. I show that coordinating these theories in a mathematics classroom relates students' moment-to-moment discursive acts to their resulting classroom positions. I first describe how, on its own, Status Theory offers a way of understanding how valued status characteristics lead to generalized expectations for competence and an individual's status. I then describe how Positioning Theory offers an in-depth look at the relationship between moment-to-moment discursive acts and an individual's resulting position. I argue that by coordinating these two theories, discursive positioning moves mediate the development of expectations for individuals' competence, over time. Participants will engage in transcript analysis.

Analyzing Mathematics Teacher Learning Using Frame Alignment Processes

Discussion Session

We describe a cross-university research collaboration project aimed at understanding how mathematics teachers become inducted into the profession in a positive way. Preliminary analyses suggest that teacher learning is productively linked to a teacher's frame alignment processes over time. We will explain this linkage through cases from our data that compare an individual teacher's interpretive orientation with NCTM's vision for teaching and learning mathematics. Participants will examine multiple excerpts from our data and help us think about how to move our ideas forward in ways that are productive, novel, and helpful to a broad audience.

Expanding Horizons in K–3 Geometry and Spatial Thinking: The Implementation and Results of a New Curriculum and PD Model

Invited

Geometry is inherently spatial; an historical pillar of mathematics that involves perceiving, visualizing, manipulating, and reasoning about spatial relationships. And yet, geometry and spatial thinking are neglected focal points of early mathematics instruction (Clements and Sarama 2011; Davis and the Spatial Reasoning Study Group 2015). This neglect occurs despite large-scale efforts by NCTM and NRC to promote the foundational importance of geometry and spatial instruction throughout K–12 education. In this session, we report on a two-year study that engaged both teachers and their students in an experimental approach to early years geometry and spatial instruction. We share results that demonstrate the powerful effects of attending to and supporting young children’s geometrical and spatial thinking throughout the school year. Not only did the teacher-led intervention support children’s geometric and spatial thinking, but it appeared to support basic number skills as well. In addition to sharing the effects of the intervention, we also highlight our unique teacher-researcher Professional Development (PD) model, theorizing about the critical mechanisms believed to drive both teacher and student change. A recurring theme throughout the presentation will be a discussion on the reconceptualization of early geometry instruction from a spatial lens. In short, we will look to shift the current focus of early geometry from its current static approach (e.g., labeling and sorting shapes) to one that is dynamic, spatial, and imaginative.

Making Content Explicit: The Practice and Beginners' Skills

Discussion Session

The session focuses on the teaching practice of making content explicit as key to equitable access to and success with complex mathematics. We define what we mean by this practice, distinguishing it clearly from direct instruction and showing how it can be done in ways that do not do the mathematics for the students. We offer a decomposition of the practice into specific elements that can be taught to novice teachers. Additionally, we share a tool for assessing beginners' progress with this practice. Drawing on data from a study using this tool, we report on patterns we found in beginning teachers efforts to make content explicit, and consider what this might tell us about the challenges in learning this practice and implications for teacher preparation.

Persistence, Instruction, and Coordination in the National Study of Calculus

Research Symposium

This research symposium examines three aspects of successful Calculus I programs in the United States: persistence, instruction, and coordination. The presentations use data collected as part of the Mathematical Association of America's (MAA's) national study of Characteristics of Successful Programs in College Calculus (CSPCC). The work presented in the three papers in the symposium is informed by various theoretical frameworks from education, higher education, and instruction. The availability of different types of institutions also allow for investigations of the contexts in which these two features are enacted. In spite of the repeated calls for improving college Calculus I, it seems that very little progress has been made. Investigating the experience of students in college calculus is highly relevant to secondary educators to better understand experiences they are preparing their students for and how those relate to students' high school calculus experience.

Plenary: How Research into Second-Language Learning Might Be Useful to Mathematics Educators

Plenary Sessions

I draw on longitudinal collaborations with practicing teachers to suggest that a shift in teaching practice can be analogous to learning a new language. Borrowing from research into second-language learning, I offer descriptions of three distinct types of speaker in the mathematics teaching communities with which I work: a few unilingual native speakers (Traditionalists), some fluently bilingual speakers (Reformers), and many speakers of a “mixed language” in which sensibilities are intermingled. While the emergence of mixed-language speakers generally signals significant cultural evolution, it can also be problematical because speakers can appear bilingual well before they understand the nuances of the new language. Consequently, necessary supports are sometimes withdrawn prematurely, before sensibilities are understood deeply enough to transform practice. Using the example of spatial reasoning, and drawing further on the literature of second-language learning, I speak to emerging foci for research, teacher education, professional development, and classroom resources.

Investigating Online Homework: How Do Teaching Practices Change?

Brief Research Report

When students do homework, an online tool such as ASSISTments can provide immediate feedback and can organize students' practice according to research-based principles. When homework is online, teachers can more easily monitor student work, use student work in their discussions, and see which problems presented challenges. Doing homework online can lead to adaptive pedagogies. We report on a large study involving 93 seventh-grade teachers from 47 middle schools in the state of Maine. The overarching questions examine the impact of ASSISTments on student learning. Herein we focus specifically on whether teachers' practices change when they use online homework and whether students benefit.

Linking Teacher Concerns and Professional Development with the CCSSM Implementation

Brief Research Report

The purpose of this mixed methods study was to investigate and understand the concerns of secondary mathematics teachers during the initial stages of implementing the Common Core State Standards of Mathematics and to determine if a relationship existed between the

concerns and professional development during the initial stages. The research was grounded in the theoretical framework of the Concerns Based Adoption Model focusing on the Stages of Concern. Data analysis methods encompassed quantitative, qualitative, and profile interpretation. Data gathered from this study is relevant as it could be used to project levels of use in subsequent stages of the curriculum implementation. These projections can be used by education leaders to design interventions and effective professional development aiding teachers in the continued implementation of CCSSM and to guide change facilitators to understand the relationship between teacher concerns and professional development.

Maintaining High Levels of Cognitive Demand through Student Silence

Brief Research Report

Student engagement in high-level cognitive demand instruction is pivotal for student learning. However, many teachers are unable to maintain such instruction, especially in instances of non-responsive students. This case study of three middle school teachers explores prompts that aim to move classroom discussions past student silence. Prompt sequences were categorized into progressing, focusing, and redirecting actions, and then analyzed for maintenance of cognitive demand. Results indicate that prompts that raise cognitive demand typically start out as procedural or concrete and progress to include students' thoughts or ideas about mathematical concepts. This presentation aims to discuss implications on how teachers can use prompting techniques to effectively maintain high levels of cognitive demand during student silence.

Principals and Implementation on Common Core State Standards for Mathematics**Brief Research Report**

As noted in *Principles to Actions*, principals' practices can influence successful implementation of CCSSM. In this literature review, twenty-nine studies are analyzed and synthesized to understand how principal instructional leadership influenced teachers' classroom instruction with a particular focus on CCSSM. Overall, researchers have found that principals can influence instruction primarily through indirect practices, such as working with teachers to define an instructional vision. Additionally, the degree of principal involvement with instruction was most effective when it served to understand how to support teachers through professional development rather than direct feedback. Overall, the studies reviewed provide evidence on how principals influence instruction, yet more needs to be understood particularly in relation to CCSSM and how local contextual factors influence instructional leadership.

The Algebraic Thinking of Teachers in China and the U.S.**Brief Research Report**

The study investigated 20 Chinese and 20 U.S. high school teachers' interpretation and response to a student's errors in solving a quadratic equation. Analysis results show that the Chinese teachers provided more negative evaluations toward students' errors and identified more students' errors than the U.S. teachers did. Responding to students' errors, the two groups of teachers highlighted conceptual explanations targeting students' mistakes. The U.S. teachers were more likely to provide general knowledge guidance while the Chinese teachers tended to go back to basic knowledge.

Examining 6–12 PSTs' Attention to Curriculum Materials When Planning

This session describes an exploratory study that examines one aspect of Curricular Noticing. Specifically, what did secondary PSTs attend to in their curriculum materials when planning a lesson from a reform-oriented curriculum?

Lesson Study in Florida: Unveiling the Process of Professionalism Development

Research Symposium

Principles to Actions discusses lesson study as an exemplar professional development context in which teachers collaboratively research and reflect on their lessons, classroom practices, and student learning, and hold themselves and colleagues accountable for the success of all students. Florida is the first state to promote lesson study statewide in the United States. In this symposium, we will present five studies that investigated different aspects of this state-wide implementation of lesson study in Florida and its influences on schools, both quantitatively and qualitatively. Each paper frames the situation with different research questions, and after short presentations of each paper, we will invite audience to together discuss about development of professionalism of mathematics teachers.

Managing Students' (Apparently) Incorrect Mathematical Responses

Discussion Session

Though there are many teaching practices that matter for student learning, one practice that is embedded within many of these and is ubiquitous to teaching is the practice of managing students' incorrect responses. This session will explore the work of teaching involved in the enactment of this complex practice.

MET Grants Support Classroom Research

Invited

Action and classroom research grants available through the MET will be described as possible funding sources for mathematics education research. Brief reports from three classroom research projects funded by the MET will be presented: Fostering Number Sense of Diverse Young Learners; Navigating Ratios and Proportions in a Project-Based Learning Environment; Student Built Widgets in a Pre-Calculus Class.

Measuring and Supporting the Improvement of Mathematics Teaching at Scale

Discussion Session

With the advent of CCSSM, states have been thrust into managing large-scale instructional improvement in mathematics. We describe our emerging theory of mathematics teaching for the Common Core era and provide early evidence of the internal and consequential validity of a set of newly developed measures for monitoring and supporting this vision across an entire state.

Prospective Pre-K–8 Teachers' Selection of Initial Problem-Solving Strategies

Discussion Session

We examined prospective teachers' problem-solving strategies for three non-routine problems introduced at the beginning of a three-course pre-K–8 mathematics content sequence. Students relied heavily on guess-and-check or algebraic strategies at the expense of more visual or intuitive approaches. Participants of this session will analyze examples of student work on these tasks and discuss the implications of students' problem solving strategies with respect to pre-K–8 mathematics content courses.

Scaffolding Coherence in Digital Worlds Using CCSSM-Aligned Learning Maps

Discussion Session

In light of the CCSSM standards, and reduced budgets for school districts, it is now common for teachers and district leaders to construct significant portions of their curricula from online resources. However, recent research suggests that few tools exist to guide this work, and that current approaches often lead to fragmented learning experiences for students. In this session, presenters describe a learning map and corresponding diagnostic assessment system designed to support teachers to construct coherent instructional experiences for middle school students from online resources aligned to CCSSM. The learning map represents student thinking using the idea of Relational Learning Clusters, and presenters will describe how research on learning trajectories is represented in the map. Attendees will explore the map, assessments, and discuss opportunities and challenges in this new line of work.

Teachers' Uses of Curriculum and Assessment with the Common Core

Research Symposium

This symposium presents four studies from a larger research project involving 92 middle school mathematics teachers. Drawing on multiple data sources (e.g., classroom observations, background interviews, lesson planning interviews), we studied teachers' perceptions and uses of the Common Core (CCSSM), curriculum materials, and assessments. Presentation 1 focuses on teachers' perceptions of CCSSM-aligned assessments in relation to the official and operational curricula. Presentation 2 presents findings on teachers' classroom-based assessment practices and resources in the context of CCSSM. Presentation 3 discusses case studies of eight teachers with a focus on curricular noticing when planning and enacting lessons. Presentation 4 presents case studies of four special education teachers' curricular noticing for students with special needs. Findings and implications for researchers, teacher educators, curriculum and assessment designers, and policymakers will be discussed.

Transformative Math Teaching and Learning: Stories from Railside High

Invited

What does it take to create and sustain a community of learners—teachers and students—that collectively works toward supporting all students to fully engage with learning meaningful and empowering mathematics? Join us as we share our stories about teaching and learning math at Railside High from a variety of perspectives, including those of Railside students, math teachers, researchers, and contributors to the new book, *Mathematics for Equity*. This session includes posters about various pieces of research done at Railside, opportunities to interact with Railside students and teachers, and a whole-group discussion about what makes transformative teaching and learning possible, challenging, and necessary.

Mathematical Discourse in a Kindergarten Classroom: A Case Study

Brief Research Report

Classroom discourse is integral to mathematics instruction at all levels. This work is challenging at all levels but especially for very young learners who are just beginning to learn the language of school. In this talk, we explore the following questions: How can kindergarten teachers support students in engaging in mathematical discourse? How do kindergartners engage in mathematical discourse? We use a case study of one kindergarten teacher's classroom to look for the answers to this question, and we conclude that kindergartners are capable of authentic mathematical discourse using multiple modalities including formal and informal language, acting on manipulatives, drawings, gestures, and formal symbols. The teacher played a crucial role in supporting students in this work through laying groundwork for productive discourse, intentionally facilitating students' sharing of ideas about mathematics, and refining students' discourse toward more precise and sophisticated communication.

189 Mathematics and the African American Males' Graduation Success

Brief Research Report

The purpose of the study is to examine the relationships among graduation of African American males from predominantly White institutions and historically Black colleges and universities and their mathematics self-efficacy, mathematics anxiety, mathematics attitude, deep learning, peer relationships, faculty relationship, major of study, social capital, and life satisfaction after graduation and critical race identity. Mathematics is the most important predictor of academic success at postsecondary institutions. The types of math courses students take in college affect their college graduation and their earning capacity in the job market. Students who take more advanced math classes will learn skills that might be directly applicable to certain jobs, and those learned skills are more strongly correlated with labor market success than other measures of student achievement. Critical race theory is the theoretical framework of this study.

Predictors of Mathematics Achievement**Brief Research Report**

The purpose of this study is to examine the predictors of mathematics achievement in deaf and hearing college students. More specifically, this study was (1) to investigate the possible associations among cognitive skills, fractional knowledge, and mathematics achievement in both hearing and deaf students groups; and (2) to determine whether mathematics achievement can be better predicted by fractional knowledge among college students. This study indicated that fractional knowledge is a strong predictor of mathematics achievement in both hearing and deaf students.

Preservice Elementary Mathematics Lesson Study: Visions and Learning to Teach**Brief Research Report**

This study investigated the learning process of preservice elementary teachers (PSTs) through lesson study in a mathematics teaching methods course. Lesson study meeting data of kindergarten PSTs were analyzed to examine the shifting focus on (1) student collaboration in classroom (vision), (2) teaching practices (making content accessible), and (3) understanding of student thinking of mathematics, in teachers' talks. The four learning phases were identified in which the PSTs' vision guided sense-making process, where lesson study provided the structure for the process. Visions can support or distract PSTs' learning, and learning experiences should guide PSTs to understand how to enact their visions in relationship to classroom practices.

Teachers as Problem Solvers: Insights from Professional Development**Brief Research Report**

This exploratory phenomenological study centers on secondary educators' problem-solving experiences with the use of open-ended tasks. An analysis of a three-week professional development program focused on supporting middle school teachers' conceptual and procedural knowledge through a first-hand involvement in problem solving processes. Data from journal reflections, mathematical work samples, and video segments are presented to explore educators' personal experiences as learners and teachers of problem solving. The participants of this session will gain further understanding regarding the use of problem-solving tasks to support teacher content and pedagogical knowledge, consider a diverse set of teacher perspectives, and discuss implications for instructional practice.

Preservice Teachers' Use of Schema-Based Diagrams for Teaching Word Problems

Brief Research Report

Solving addition and subtraction word problems is an important, yet difficult task for both elementary students and teachers. Categorizing problem types and using schema-based diagrams in teaching are regarded as effective strategies to help students conceptualize and solve word problems. Therefore, in this study, elementary preservice teachers learned how to integrate word problem types with diagrams. Using video analysis, we examined the characteristics of these preservice teachers' understanding of addition and subtraction word problem types and their use of schema-based diagrams to represent and solve these problems. The study revealed that while participants had abilities in using diagrams to solve word problems procedurally, their conceptual understanding of problem types and accuracy in using schema-based diagrams was limited. The results implied that future research and teacher preparation should focus on improving preservice teachers' mathematics knowledge.

Refinement of the Conceptual Models for Integer Addition and Subtraction

Brief Research Report

The Conceptual Models for Integer Addition and Subtraction (CMIAS) were initially developed from the stories that students posed for integer addition and subtraction open number sentences. Three grade

5 students participated in a 12-week teaching experiment where they solved open number sentences for integer addition and subtraction open number sentences in four Individual Sessions. The students' responses (verbal and drawings) as they solved these open number sentences were analyzed. This data supported the refinement of the CMIAS. The refinement of the CMIAS, which includes the changes that were made to initial descriptors and the data that supported these refinements, will be highlighted.

Reforming an Increasingly Reductionistic U.S. Mathematics Education Culture

Brief Research Report

Significant reduction-based aspects of U.S. mathematics education (that limit student/teacher learning and systemic reform initiatives) are compared, clarified, and classified with more holistic approaches used by other high-achieving nations. I detail a new theoretical framework that maps general U.S. classroom pedagogy onto U.S. teaching culture and professional development approaches; I argue that U.S. mathematics education reform attempts of the last several decades have utilized similar (reduced) pedagogical approaches at the systemic level. I recommend simple strategic shifts to harness potential (but as yet, dormant) U.S. education strengths.

Rethinking Elementary Preservice Teachers' Addition Strategies

Brief Research Report

This presentation will focus on an exploratory study of how elementary preservice teachers (PSTs) communicated their mathematical thinking while solving carefully selected, multi-digit, addition problems. The numbers were purposefully chosen for the problems to elicit both procedural and conceptual knowledge. This presentation seeks to demonstrate that although many PSTs used the standard algorithm, some simultaneously used unprompted conceptual strategies based on their own prior mathematical knowledge and experiences. This presentation will discuss the implications of this study for mathematics teacher educators as they leverage the nuanced ways that PSTs' communicate their mathematical thinking while developing PSTs' pedagogical content knowledge.

Teachers' Beliefs: Relationships with Accountability Pressure and Student Achievement**Brief Research Report**

This analysis draws on multiple regression methods to examine the relationships between the accountability pressures facing schools who fail to make sufficient improvement on end-of-year state tests and the nature of teachers' beliefs and practice pertaining to inquiry-oriented mathematics instruction. Drawing on data from a longitudinal study of teachers' practice in the context of district-wide instructional improvement efforts, this analysis is framed around three research questions: i) Is there a relationship between school-level pressure to improve assessment scores and teachers' likelihood to describe productive, inquiry-oriented supports for students who struggle in mathematics? ii) Are teachers at schools facing significant accountability pressures more likely to describe and enact practices that are inconsistent with their espoused beliefs about teaching and learning in mathematics? iii) How do these institutional settings shape teachers' beliefs and practices differentially?

Teachers' MKT and Curricular Reasoning in Algebra and Statistics**Brief Research Report**

This study investigates grade 7 teachers' curricular reasoning and MKT in algebra and statistics. Although the use of curriculum materials and MKT both influence the quality of mathematics instruction, no relationship between teachers' curricular reasoning and MKT was found. Further, teachers' curricular reasoning across algebra and statistics was very similar despite differences in these fields and differences in MKT.

Kolby J. Gadd*University of Michigan, Ann Arbor, Michigan*

206

The Connections between Number and Notation: Elementary PSTs' Understanding**Brief Research Report**

This study reports on the ways that 32 elementary preservice teachers understood whole and rational numbers and notation and the connections between them at the start of their mathematics education coursework and after participation in a number and numeration unit designed to develop their understanding of the connections. Results indicate that PSTs typically did not begin their education coursework with a strong understanding of rational numbers, fractions, and decimals but were able to develop a stronger understanding during the unit. Activities that supported non-symbolic representations of both fractions and rational decimals (especially repeating decimals) were particularly supportive.
