Math Education Reform Has Been Driven by Economic Concerns

The current reform movement in mathematics education has been framed within a discussion of national economic interests.

Economic Concerns Have Long Driven Mathematics Education

Mercantile schools in 14th century Europe began teaching commercial arithmetic out of a growing economic need for efficient calculation.

Economic Concerns Have Long Driven Mathematics Education

... as business grew in the colonies, the need for more citizens to be able to perform simple arithmetic increased, and eventually, schools added arithmetic to the required subjects.

Economic/National Defense Origins of 20th Century Math Education Reforms

• WWII: American recruits did not have sufficient basic computational and problem solving skills.

• Soviet launching of Sputnik in 1957.

<tr>
<th>What is Usually Missing From Current Mathematics Education Debates?</th>
</tr>
</thead>
<tbody>
<tr>
<td>There are intense debates focusing on curriculum, teaching, learning, and assessment, but few debates on understanding the realities of children’s lives.</td>
</tr>
</tbody>
</table>
Bottom Line: I Agree

NCTM has traditionally focused on standards, curriculum, instructional practices, and assessment in a de-contextualized way – emphasizing “technical solutions” that too often have ignored the experiences of children.

We Must Recognize Students’ Realities

The work to become truly effective educators [of marginalized students] requires a new approach to teaching that embraces the complexity of place, space, and their collective impact on the psyche of urban youth ... Teaching to who students are requires a recognition of their realities.

Moving Forward

NCTM has too often narrowly addressed Access and Equity through “access” issues. We are re-framing our discussion to focus on Access, Equity, and Empowerment, to capture the critical constructs of identity, agency, and social justice.

NCTM-hosted Equity Initiative

March 24, 2016

- NASGEm
- Journal of Urban Mathematics Education (JUME)

Priority NCTM Actions:
Access, Equity and Empowerment

- Stop using deficit language

- Expand beyond Access & Equity, to include concepts of Identity and Agency

Priority NCTM Actions:
Access, Equity and Empowerment

- Incorporate discussion/examples of equity issues in the enactment of the eight effective teaching practices in NCTM’s Principles to Actions: Ensuring Mathematical Success for All (P2A) in our forthcoming grade-band teaching practices elaboration books and other P2A related materials.
Priority NCTM Actions: Access, Equity and Empowerment

- Redefine Culture and Values within and Communicated by NCTM
  - Work to make NCTM’s membership and leadership more diverse
  - Work to change the dialogue within and from NCTM

Some Connections Between Principles to Actions and Equitable Instructional Practices

---

Mathematical Identity

Mathematics identity includes beliefs about one’s self as a mathematics learner, one’s perceptions of being seen by others as a mathematics learner, beliefs about the nature of mathematics, engagement in mathematics, and perception of oneself as a potential participant in mathematics.

Building Mathematical Identity

Teachers can cultivate mathematical abilities by providing opportunities for students to make sense of and persevere in challenging mathematics. That is, students should be engaged with mathematics that requires active participation, asking questions, problem posing, and reasoning.

Berry, R. Q. III. (2016). Informing teachers about identities and agency using the stories of Black middle school boys who are successful with school mathematics. In E. A. Silver & P. A. Kenney (Eds.), More lessons learned from research: Helping all students understand important mathematics (pp. 27-54). Reston, VA: NCTM.

Teaching and Learning Principle

Teaching and Learning: An excellent mathematics program requires effective teaching that engages students in meaningful learning through individual and collaborative experiences that promote their ability to make sense of mathematical ideas and reason mathematically.

Anticipating Student Thinking Builds Identity

Teachers’ anticipation of students’ thinking and action is a form of helping students develop their identities because it conveys to students that their teachers care enough about them to understand how they think and see the world.

Berry, R. Q. III. (2016). Informing teachers about identities and agency using the stories of Black middle school boys who are successful with school mathematics. In E. A. Silver & P. A. Kenney (Eds.), More lessons learned from research: Helping all students understand important mathematics (pp. 27-54). Reston, VA: NCTM.

Five Practices to Promote Productive Math Discussions

1. Anticipating likely student responses to challenging mathematical tasks.
2. Monitoring students’ actual responses to the tasks (while students work on the tasks in pairs or small groups).
3. Selecting particular students to present their mathematical work during whole-class discussion.
4. Sequencing the student responses that will be displayed in a specific order.
5. Connecting different students’ responses and connecting the responses to key mathematical ideas.

Agency: Identity in Action

Mathematical agency is about participating in mathematics in personally and socially meaningful ways ... With a high sense of agency students can resist negative identities imposed on them by having a sense of control over their academic success.

Berry, R. Q. III. (2016). Informing teachers about identities and agency using the stories of Black middle school boys who are successful with school mathematics. In E. A. Silver & P. A. Kenney (Eds.), More lessons learned from research: Helping all students understand important mathematics (pp. 27-54). Reston, VA: NCTM.
### Agency

Teachers can affirm students mathematics identity and help them develop a sense of agency by promoting persistence and reasoning during problem solving ... Teachers can encourage students to see themselves as confident problem solvers and as active participants in mathematics.

Berry, R. Q. III. (2016). Informing teachers about identities and agency using the stories of Black middle school boys who are successful with school mathematics. In E. A. Silver & P. A. Kenney (Eds.), More lessons learned from research: Helping all students understand important mathematics (pp. 27-54). Reston, VA: NCTM.

### Eight Research-Informed Instructional Practices

<table>
<thead>
<tr>
<th>Support productive struggle in learning mathematics.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective teaching of mathematics consistently provides students, individually and collectively, with opportunities and supports to engage in productive struggle as they grapple with mathematical ideas and relationships.</td>
</tr>
</tbody>
</table>

---

### Some of Berry’s Reflective Questions on Identity and Agency

- In what ways, if any, do I affirm the identities of my students?
- What teaching practices do I use to support and affirm students’ mathematics identity development?
- How do students demonstrate high and low sense of agency in my mathematics classroom?
- How do I model a high sense of agency and how do I provide opportunities for students to demonstrate a high sense of agency?

Berry, R. Q. III. (2016). Informing teachers about identities and agency using the stories of Black middle school boys who are successful with school mathematics. In E. A. Silver & P. A. Kenney (Eds.), More lessons learned from research: Helping all students understand important mathematics (pp. 27-54). Reston, VA: NCTM.

---

### Equity-based Mathematics Teaching Practices that Strengthen Mathematical Learning and Cultivate Positive Student Mathematical Identities

**Going deep with mathematics.** Lessons include high cognitive demand tasks that support and strengthen student development of the strands of mathematical proficiency.

---

### Contextualized Cognitively Demanding Tasks

[We must] engage students, socially marginalized in their societies, in cognitively demanding mathematics ... Doing serious mathematics allows students to challenge dominant ideological messages they have internalized about their own ability ... to do academic mathematics.

---

### Supporting Emerging Bilinguals

Practices for effective mathematics instruction with EB:

- ELLs should work on challenging tasks that reflect their mathematical potential. The level of the mathematical tasks should not be lowered based on language considerations while making the context accessible.

Implement tasks that promote reasoning and problem solving.

Effective teaching of mathematics engages students in solving and discussing tasks that promote mathematical reasoning and problem solving and that allow for multiple entry points and varied solution strategies.

**Supporting Emerging Bilinguals**

Practices for effective mathematics instruction with EB:

- ELLs need to have opportunities to communicate mathematically in the classroom (beyond vocabulary) ... teachers should engage ELLs in mathematical discourse by encouraging them to make conjectures and explain their thinking.

Facilitate meaningful mathematical discourse.

Effective teaching of mathematics facilitates discourse among students in order to build shared understanding of mathematical ideas by analyzing and comparing student approaches and arguments.

**Supporting Emerging Bilinguals**

Practices for effective mathematics instruction with EB:

- Teachers should use (and encourage students to use) multiple resources to support sense making and communication – go beyond traditional forms of communication, e.g. drawings, gestures, & concrete materials.

Students’ use of everyday language should not be treated as a failure to be mathematically precise, but as a resource for communicating mathematical reasoning, making sense of mathematical meanings, and learning with understanding ... focus on the mathematical content of students’ contributions.

Equitable Instructional Practices & Connections to Supporting Principles

Access and Equity
Curriculum
Tools and Technology
Assessment
Professionalism

Guiding Principles for School Mathematics: Access and Equity

Access and Equity. An excellent mathematics program requires that all [each and every] students have access to high-quality mathematics curriculum, effective teaching and learning, high expectations, and the support and resources needed to maximize their learning potential.

Concerns with “For All”

... the language suggests a myopic focus on modifying curricula, classrooms, and school cultures assuming there are aggregate mathematical experiences that are beneficial for all children regardless of their background.

We Have to Confront Structural Obstacles

Even with the best-made plans, Herculean efforts, and supportive families, research shows how, more often than not, Latinas are forced off their paths by structural and systemic barriers such as tracking, race and gender discrimination, and negligence and low expectations among school staff.

Some Structural Obstacles

- Tracking
- Teacher assignments
- Definition of Mathematics Proficiency
- Assessment

Beliefs about access and equity in mathematics, continued

<table>
<thead>
<tr>
<th>Unproductive beliefs</th>
<th>Productive beliefs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mathematics learning is independent of students’ culture, conditions, and language, and teachers do not need to consider any of these factors to be effective.</td>
<td>Effective mathematics instruction leverages students’ culture, conditions, and language to support and enhance mathematics learning.</td>
</tr>
<tr>
<td>Tracking promotes students’ achievement by allowing students to be placed in “homogeneous” classes and groups where they can make the greatest learning gains.</td>
<td>The practice of isolating low-achieving students in low-level or slow-paced mathematics groups should be eliminated.</td>
</tr>
<tr>
<td>Only high-achieving or gifted students can reason about, make sense of, and persevere in solving challenging mathematics problems.</td>
<td>All students are capable of making sense of and persevering in solving challenging mathematics problems and should be expected to do so. Many more students, regardless of gender, ethnicity, and socioeconomic status, need to be given the support, confidence, and opportunities to reach much higher levels of mathematical success and interest.</td>
</tr>
</tbody>
</table>
**Tracking and Identity**

The power and status of school mathematics often manifest themselves in decisions about what content gets taught, to which students, and by which teachers... what gets taught in the mathematics classroom shapes the mathematics identities of both students and teachers.

---

**High-Rigor Course Access is Not a Reality in the United States**

- Nationwide 48% of high schools offer calculus.
- Nationwide 78% of high schools offer Algebra II.

---

**High-Rigor Course Access is Not a Reality in the United States**

- 33% of high schools with high black and Latino student enrollment (greater than 75%) offer calculus, compared to 56% of high schools with low black and Latino student enrollment (less than 25%).

- 71% of high schools with high black and Latino student enrollment offer Algebra II, compared to 84% of high schools with low black and Latino enrollment.

---

**Educe by the “Low-Slow” Group**

Low expectations often result in self-fulfilling prophecies. Once placed in the low tracks, it is very difficult for students to move to a higher track.

---

**Different Opportunities for Different Students**

Research indicates that students in “low grouped” classrooms are exposed to more slowly paced instruction, less advanced mathematics topics, and less emphasis on problem solving.

Tracking Persists in New Forms

Although many schools have done away with traditional three-track sorting, hidden forms of tracking persist ... For example, an algebra course might sort students into fast and slow speeds of learning, so that by the end of the year students in the same class have not had the same opportunity to learn.

Research Points: Essential Information for Education Policy, 4(2).

Educede via Tracking

Too often, schools serving large populations of minority students emphasize "slowing down" or providing less mathematics content, rather than providing more challenging content.

On Paper We’ve “De-Tracked” High School

Even with universal algebra policies, there is the real possibility that ‘tracking’ will create different ‘algebras’ for different populations of students.

Is it Even Really Algebra?

Nearly all of the class of 2005 graduated having taken "Algebra 1."

However, based on the course materials, fewer than one in four studied the kind of challenging topics needed to prepare for college-level mathematics.

Are the Teachers Tracked?

Teachers themselves are tracked, with those judged to be the most competent, experienced, or high status assigned to the top tracks and those with the least experience and training assigned to the lower tracks.

Teacher Assignments Often Exacerbate Opportunities to Learn

The assignment of less experienced teachers to lower achieving students is likely to exacerbate within school achievement gaps ...

Who is Teaching Whom?

In a study of 29 districts in 16 states, marginalized students in grades 4 though 8 had access to less effective instruction than non-marginalized students, and that lack of access persisted over time.

We Need to Challenge Course and Teacher Assignment Practices

Schools should carefully study whether their teacher assignments and tracking practices are helping or hindering equity ...

How is Mathematics Defined?

Traditional school mathematics is often constructed very narrowly:
• privileges few ways to ‘do math’
• valorizes speed and accuracy above other important mathematical skills and understanding
A narrow construction of mathematics may in fact alienate the same students we are trying to better serve.

We Need to Challenge the Definition of Mathematical Proficiency

... how students experience mathematics in their classrooms shapes their views of mathematics and themselves as mathematics learners and doers. Thus, how mathematical proficiency is defined and communicated to students has a powerful impact on their mathematics identities and their exercise of various forms of agency.

Mathematical Proficiency is Multifaceted

NRC, 2001
The Benefits of a Broader Definition of Mathematical Proficiency

For students, these broader conceptions of mathematical proficiency provide multiple ways to demonstrate their competence. That is, these expanded possibilities for developing and demonstrating mathematics competence can represent substantial opportunities to learn and engage in mathematics.

We Need to Leverage Assessment as an Equity-based Mathematics Teaching Practice

Assessment. An excellent mathematics program ensures that assessment is an integral part of instruction ... and informs feedback to students, instructional decisions, and program improvement.

We Need to Leverage Assessment as an Equity-based Mathematics Teaching Practice

The types of feedback that students receive can have a tremendous impact on the progress of their mathematical learning and their conceptions of themselves as mathematics learners ... feedback tends to accentuate what students do not know and cannot do, thus leading them to believe that they are 'not smart,' lack ability, or cannot learn.

We Need to Leverage Assessment as an Equity-based Mathematics Teaching Practice

We Need to Leverage Assessment as an Equity-based Mathematics Teaching Practice

Revising Work

• “Homework” should count for very little of a student’s grade
• Nearly every assessment should be “formative”
Guiding Principles for School Mathematics: Professionalism

**Professionalism.** Educators hold themselves and their colleagues accountable for the mathematical success of every student and for their personal and collective professional growth toward effective teaching and learning of mathematics.

---

We Need to Challenge the Professionalism Obstacle

In too many schools, professional isolation severely undermines attempts to significantly increase professional collaboration ... A danger in isolation is that it can lead to teachers developing inconsistencies in their practice.

---

We Need to Collaborate to Promote Equitable Outcomes

There is growing consensus that equitable educational outcomes are not the consequence of a single teacher but rather the product of teams of teachers ... something about collaboration – a certain kind of collaboration – supports ongoing improvement and provides teachers a sense of collective responsibility for students that can make a big difference in student learning.

---

Why do we teach mathematics?

---

The NCTM Vision Statement

We envision a world where everyone is enthused about mathematics, sees the value and beauty of mathematics, and is empowered by the opportunities mathematics affords.

---

What Does it Mean to be Empowered by Mathematics?

- It is more than college and career preparedness
- It is more than enhancing our country’s economic competitiveness & national defense
- Mathematical learning experiences impact how one see’s oneself
- Mathematics is an essential analytical tool to understand and potentially change the world -- social justice
Traditionally, mathematics education has been connected to issues of national economic survival, rather than to the development of democratic citizenship through critical thinking in mathematics.

It is equally important to recognize that improving opportunities for employment is a real expectation that students and parents have of school. But preparation for the job market is indeed preparation for the capability of dealing with new challenges.

Students recognize the power of mathematics as an essential analytical tool to understand and potentially change the world, rather than merely regarding math as a collection of disconnected rules to be rote memorized and regurgitated.

Students can deepen their understanding of important social issues.

Students can connect math with their own cultural and community histories.

Students can understand their own power as active citizens in building a democratic society and become equipped to play a more active role in that society.

Students can become more motivated to learn important mathematics.

Mathematics literacy is essential to informed and active citizenship. We live in a world where mathematics is increasingly used to characterize societal problems and formulate solutions.

Without mathematics literacy and a positive sense of mathematics identity and agency, ordinary citizens are unlikely to comprehend, let alone challenge, many of the decisions and actions of those in power in political, social, scientific, and economic institutions.
We want to live in a society where citizens not only have the agency to improve their own lives, but the lives of others and society at large. Each and everyone of us is engaged in an enterprise much bigger than the specific tasks of our daily job.

<table>

To remain indifferent to the challenges we face is indefensible. If the goal is noble, whether or not it is realized within our lifetime is largely irrelevant. What we must do therefore is to strive and persevere and never give up.

Dalai Lama XIV
